Paper:
Problem:
Problem Type: Calculate PV(commuted claims), WITH risk margin

| Notation: | TMF $=$ | Total Margin Factor |
| :--- | :--- | :--- |
| Concept: | TMF $=$ | (req'd margin $) \times$ (target cap to req'd ratio $) \times$ (risk cost of capital) |

## Given:

Assume:

All information is as at yr-end: 2012
undiscounted liabilities to be commuted:
risk-free rate:
required margin:
target capital to required ratio: 180\%
risk cost of capital: 5\%
calendar yr payments:

| 2013 | 350,000 |
| ---: | ---: |
| 2014 | 150,000 |
| 2015 | 0 |
| 2016 | 0 |

All pmts are made in the middle of the year

| PV(w/o margin): |  | calendar year pmts | that's why the exponents for the margin are integers |  | margin: |  | \# yrs to discount <br> (7) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | \# yrs to discount <br> (3) | discount <br> @ 1\% <br> (4) | TMF = | 0.90\% |  |  |
|  | (1) |  |  | pmt rem @ beg yr (5) | $\begin{aligned} & \text { TMF } \\ & \times(5) \\ & =(6) \\ & \hline \end{aligned}$ | discount <br> @ 1\% <br> (8) |  |
| 2013 |  | 350,000 | 0.5 | 348,263 | 500,000 | 4,500 | 1 | 4,455 |
| 2014 |  | 150,000 | 1.5 | 147,778 | 150,000 | 1,350 | 2 | 1,323 |
| 2015 |  |  |  |  |  |  |  |  |
| 2016 |  |  |  |  |  |  |  |  |
|  |  |  |  | 496,041 |  |  |  | 5,779 |

Note 1: The (\# of yrs to discount) is DIFFERENT for calc'ing the PV(w/o margin) and the corresponding margin. Refer to columns (3) and (7).

| Note 2: | Think of (6) as the "cost of capital". The intermediate steps are: |
| :--- | :--- | :--- |
| req'd margin $=$ (5) $\times$ req'd margin <br> target capital $=$ (5) $\times$ req'd margin $\times$ (target capital to req'd RATIO) <br> cost of capital $=$ (5) $\times$ req'd margin $\times$ (target capital to req'd RATIO) $\times$ risk cost of capital |  |
